5. Reasons for Biasing

This section explains why bias penalties were applied, showing the deviation from expected voting patterns.

How Bias is Determined:

Bias is detected when a voter gives a rank that deviates significantly from the average rank given to a member. The deviation threshold is calculated as $(\text{max_score} - \text{min_score}) / 3$, which for this group is 0.33. If a voter's score deviates from the mean score by more than this threshold, a bias penalty equal to -2 is applied. The allowed range for each vote is the mean score \pm the deviation threshold.
